that, dhat, *a.* [THOSE, dhōz, *pl.*] **1.** The (one) specially designated: an emphatic word of greater definitive force than *the*, and having reference to some person or thing mentioned, understood, or definitely pointed out; as, *that* man; *that* circumstance: in this use sometimes an expression of surprise or contempt; as, will you go for *that* reason? she consorts with *that* fellow. **2.** Such: followed by *that* or formerly by *as*; as, he was of *that* fame that soldiers win. **3.** The (one) there: correlative to *this*; an alternative or distributive use often referring to that which is more remote in order, time, or place; as, do you choose *that* or *this* book? *that* cloak is mine, and *this* one is yours.

Historically this word is a neuter inflection of the demonstrative that gave rise to the definite article *the*, and retains its demonstrative, definitive, and restrictive force. Its various uses have led to its classification as an adjective, pronoun, conjunction, relative, and even an adverb, according to the syntactical function it appears to perform. See THAT, *pron.*; THAT, *conj.*

that, *pron.* **1.** As a demonstrative: (1) The person or thing implied, mentioned, understood, or especially pointed out: often used for emphasis; as, see *that*; a deed so fell as *that*; *those* are not mine; ah, *those* were golden days. (2) The person or thing there or in the second place: correlative with *this*; as, *this* or *that*, it matters not.

That often refers to a phrase or a clause, or to a thought understood, as a single syntactical element; as, to denounce dishonor, *that* was his purpose; he rides well, *that* is, he has a good seat; he will come, and *that* soon. The clause it represents may be introduced by a relative; as, *that* which I do ye know not now; he said *that* which I saw was a mirage. When the relative is suppressed *that* has the force of a compound or indefinite relative; as, I do *that* ye know not now. In this use it has been superseded by *what*.

2. As a relative, who or which; now commonly introducing a restrictive clause.

In Anglo-Saxon *that* and *the* are the regular relatives, *who*, *what*, and *which* being only interrogatives; but these latter-named gradually assumed the force of relatives, and in some uses have superseded *that*. *That*, in modern use, rarely introduces, being simply demonstrative and restrictive, and often preceded by the definite article. Thus we say: Washington, *who* was the first President, is often called Father of his country. *The* Washington *that* emigrated to this country was his ancestor. In the first sentence *that* could have been used formerly, but is never so used now; in the second, however, *who* may be used, though many object to its use as confusing. *Who* or *which* may be governed by a preposition, but *that* used relatively is not, except as a preposition may be placed at the end of a predicative clause; as, we say the rumor *to which* he referred, but the rumor *that* he referred *to*. When *that* is used to introduce a restriction it is unemphatic and is pronounced that; as, there is time enough for that *that* you seek.

[< AS. *thæt*, that, < pronom. *th-* (demonst.).]

Phrases:—**and all that**, and all of that sort; loosely, et cetera; and so on.—**at t.**, in consideration of that; upon that.—**t. time**, then.—**to put this and t. together**, to draw conclusions.

that, *conj.* [*That* is used primarily to connect the substantive sentence as a subordinate clause with its principal sentence. Beginning with the simple relation of fact or matter of fact, it takes in relations of purpose, reason, consequence, result, etc.]

The conjunction *that* . . . is in English, in the most comprehensive sense, the conjunction of the subordinate sentence generally, so that it was once attached to almost all conjunctions, as it still is or may be subjoined to some. MÄTZNER *English Grammar* tr. by Grece, vol. 1, pt. 1, § 2, p. 421. [MUR. '77.]

1. As a fact that: introducing a fact; as, we all know *that* sin and sorrow go together. **2.** So that; in order that; to the effect that; introducing a reason or purpose, an object or tendency; as, he told me this *that* it might encourage me. **3.** For the reason that; seeing that; on the ground that; inasmuch as; because; since: introducing a reason.

She lov'd me for the dangers I had pass'd;
And I lov'd her *that* she did pity them.
SHAKESPEARE *Othello* act 1, sc. 3.

4. As a result: introducing a result, consequence, or effect: generally as correlative to *so* or *such*; as, he bled *so* profusely *that* he died. **5.** As a consequence: introducing, in elliptical form, an observation of surprise, or strong and sudden emotion, the ellipsis furnishing the reason of which this is the consequent; as, O, *that* he should use me thus! **6.** Would that: expressing earnest hope, and usually preceded by *O*; as, O *that* I were dead! **7.** At which time; when; as, was it not last fall *that* he was to have written? the day came *that* she wept no more. **8.** Used emphatically, after a preposition, adverb, or conjunction, such word itself becoming conjunctive; as, *after that* he had spoken; I do not know *but that* you are right: sometimes as a Gallicism to avoid repetition of a preceding conjunction; as, although I'm old and *that* I am weary, I am still equal to the task.

That as a conjunction retains much of its force as a demonstrative pronoun, and was considered by Horne Tooke, as it is by others, to be oftentimes nothing else. Thus the sentence "I am told that you are miserable" may be transposed into "You are miserable; I am told *that*."

The theater at Athens held 27,500 persons. As a frequently recurring tendency of the mind, especially among Orientals, theosophy has appeared in many forms, as in the speculations of the old Egyptians and of the Neo-Platonists and Gnostics, in the avatars of Brahmanism, in cabalism, and in the speculations of Schelling, Baader, Swedenborg, etc.

> *There* is frequently used correlatively with *where* to express indefinite place; as, "*Where* two or three are gathered together in my name, *there* am I," *Matt.* xviii, 20.

2. To that place; in that quarter or direction; thither; as, when will you be going *there?* **3.** At that stage or point of action or proceeding; at that condition of affairs; as, *there* he failed; matters didn't rest *there.* **4.** Used indefinitely or as an expletive before verbs of being or action, in which case the subject precedes *there* or follows the verb; as, "*there* can no evil befall a good man," which may also be expressed "no evil can befall a good man"; *there* arose a papal schism in that year; a knight *there* was of humble mien. In direct interrogative clauses this expletive use of *there* is inverted; as, what hope is *there* for him? come *there* songs in the night?

> *There's* a dance of leaves in that aspen bower,
> *There's* a titter of winds in that beechen tree,
> *There's* a smile on the fruit, and a smile on the flower,
> And a laugh from the brook that runs to the sea.

Synonyms: accordingly, because, hence, since, then, thence, therefore, wherefore. *Therefore* is the most precise and formal word for expressing the direct conclusion of a chain of reasoning; *then* carries a similar but slighter sense of inference, which it gives incidentally rather than formally; as, "All men are mortal; Cæsar is a man; *therefore* Cæsar is mortal"; or, "The contract is awarded; *then* there is no more to be said." *Consequently* denotes a direct result, but more frequently of a practical than a theoretic kind; as, "Important matters demand my attention; *consequently* I shall not sail to-day." *Consequently* is rarely used in the formal conclusions of logic or mathematics, but marks rather the freer and looser style of rhetorical argument. *Accordingly* denotes correspondence, which may or may not be consequence; it is often used in narration; as, "The soldiers were eager and confident; *accordingly* they sprang forward at the word of command." *Thence* is a word of more sweeping inference than *therefore,* applying not merely to a single set of premises, but often to all that has gone before, including the reasonable inferences that have not been formally stated. *Wherefore* is the correlative of *therefore,* and *whence* of *hence* or *thence,* appending the inference or conclusion to the previous statement without a break. The Clamond Thermoelectric Generator.

The upper figure is a horizontal section, the lower an elevation. As seen in the former, the spindle-shaped plates of alloy are connected in series by iron wire, forming a flat ring. Many of these rings are placed one above the other, separated by asbestos paper. A gas-jet in the enclosed cylindrical space heats all the inner ends of the plates, and the other ends are cooled by radiation.

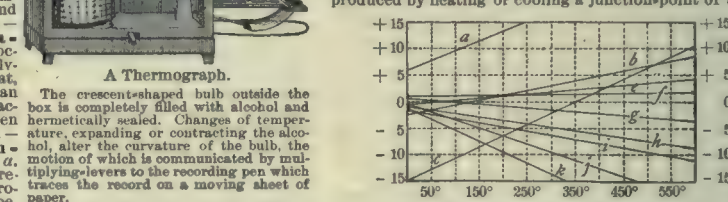
—**laws of thermodynamics**, the two laws (1) that heat may be measured in units of mechanical work (involving the conservation of energy), and (2) that heat can not pass of itself from a colder to a hotter body.



ther″mo-e-lec′tric, thĕr″mō-ę-lec′tric, *a.* Of or pertaining to thermoelectricity; denoting electricity produced by heat. **ther″mo-e-lec′tric-al‡.**

A Thermograph.

The crescent-shaped bulb outside the box is completely filled with alcohol and hermetically sealed. Changes of temperature, expanding or contracting the alcohol, alter the curvature of the bulb, the motion of which is communicated by multiplying-levers to the recording pen which traces the record on a moving sheet of paper.

A Thermoelectric Diagram.

Lead is taken as the standard metal. The distance of a point on the line of any metal, above or below the lead-line (0, 0), represents in microvolts the thermoelectric power of that metal with respect to lead, at the temperature denoted by the distance of the point from the left of the diagram. Thus, at 300° C. iron has a thermoelectric power of —2.5 microvolts with respect to lead. Where two lines cross they have the same thermoelectric power, and will give no thermo-current; thus iron and zinc can not be used in a thermopile at a mean temperature of 200° C. *a*, palladium; *b*, platinum; *c*, iron; *e*, tin; *f*, aluminum; *g*, brass; *h*, copper; *i*, silver; *j*, zinc; *k*, cadmium.

moelectric couple or pile.—**t. power**, the potential difference in a circuit of two metals at a given mean temperature when one junction is half a degree above and the other half a degree below that mean.

ther″mo-e-lec″tric′i-ty, thĕr″mō-ę-lec″tris′i-ti, *n.* Electricity generated by differences of temperature, especially that due to the fact that two different metals in contact show a difference of electric potential that varies with the temperature of the point of junction. Hence, if two conductors of different metals are joined end to end, so as to form a closed circuit, and the points of junction are kept at different temperatures, a continuous current of electricity will flow through the circuit. The thermoelectric power of different metals varies with the metal and with the mean temperature. See THERMOELECTRIC DIAGRAM. [< THERMO- + ELECTRICITY.]

—**ther″mo-ge-net′ic**, **ther-mog′e-nous**, *a.*

ther-mom′e-ter, thĕr-mom′ę-tęr, *n.* **1.** An instrument for measuring temperature. See TEMPERATURE.

Thermometers usually act upon the principle that changes of temperature cause greater alteration in the dimensions of one body than of another; thus air, mercury, alcohol, etc., within a glass or metal envelope expand more than the envelope, and the difference of expansion becomes a measure of the temperature. The ordinary glass thermometer consists of a capillary tube or stem with bulb containing mercury. The temperature is determined by reading the position of the end of the liquid column in the stem on a scale of conventional degrees. The temperature at which pure ice melts and that at which steam escapes from pure water boiling under atmospheric pressure are employed universally on thermometric scales as fixed points known respectively as the *freezing-point* and the *boiling-point*. In the Réaumur scale the freezing-point is marked zero and the space between this and boiling-point is divided into 80 degrees. In the centigrade scale the freezing-point is zero and the boiling-point 100 degrees. The Celsius scale (in disuse) is the reverse of this. In the Fahrenheit scale the freezing-point is 32° and the boiling-point 212°. To reduce degrees of one scale to those of another, the following formulas will serve, the initial letters representing the respective scales:

$$F = {}^9/_5\,C + 32 = {}^9/_4\,R + 32$$
$$C = {}^5/_9\,(F - 32) = {}^5/_4\,R$$
$$R = {}^4/_9\,(F - 32) = {}^4/_5\,C$$

2. Figuratively, anything that indicates temperature, as a rheumatic joint. [< THERMO- + -METER.]

The figures written beneath the bass notes show the shorthand method of writing the chords that are given in full in the treble.

part accompanied by shorthand marks, usually numerals, denoting intervals, placed below the staff, to indicate the general harmony; also, the system of marks thus used.

In former times much music was written thus, especially in the 18th century, when the most complicated organ accompaniments were thus represented on a single staff beneath the vocal score. Chords were never printed in full, as now, and every musician was expected to be able to play the entire harmony from a figured bass. The system is now generally in disuse, though taught as a discipline.

The Art of playing from a *Thoroughbass* still survives—and even flourishes—among our best Cathedral Organists. The late Mr. Turle, and Sir John Goss, played with infinitely greater effect from the old copies belonging to their Cathedral libraries, than from modern 'arrangements' which left no room for the exercise of their skill. tide, *n.* **1.** *Astron.* The periodic rise and fall, or flow and ebb, of the oceans and the waters connected with them, due to the attraction of the sun and moon.

By the law of gravity the attractive force of the sun and moon decreases with the square of the distance, hence the nearer surface of the earth is attracted more strongly and the farther surface less strongly than the center, and the resultant effect is to cause a tendency to recede from the earth's center in parts of the earth just under the sun or moon and also on the side farthest from them. The waters of the ocean are free to yield to this tendency, and hence tend to be heaped up into four tidal waves, two lunar and two solar, of which the lunar greatly predominate, the others being noticeable chiefly by their action in reenforcing or diminishing these. As the earth turns these waves cause two principal alternations of high and low water every 24 hours in every part of the ocean, called **flood-tide** and **ebb-tide.** When the solar and lunar tides act together, the maximum tide, called **spring-tide,** takes place; when they are 90° apart there is a minimum, called **neap tide.** The tidal wave is so affected by various conditions, as the configuration of coasts, the direction of winds, the interference of different parts of the same wave, etc., that the resulting phenomena often become very complex.

The highest *tides* take place when the sun, the moon, and the earth are in the same straight line.

(*c*) The portion of duration allotted to some specific purpose. (*a*) The portion of duration allotted to the present order of things in the universe, considered as having a beginning and an end between an eternity past and an eternity future, or (*Metaph.*) distinguished from *eternity* as characterized by a different mode of existence. Compare ETERNITY, 1. (*b*) The portion allotted to human life or to any particular life; the present life as contrasted with future.

3. *Metaph.* (1) Continuous or unlimited duration regarded either (*a*) without reference to events occurring or comprised in it, or (*b*) as furnishing the ground for continuous and changing existence, and for the relations in which events stand to each other, or to the consciousness of the thinking subject. (2) The metaphysical notion of such duration.

Touching the nature of time and the origin of the notion, philosophers have differed on lines similar to those that have divided them regarding space. (Compare SPACE.) Thus, concerning its nature, (1) some, as Kant, hold that it is not objective, but purely subjective and a formal condition a priori of phenomena in general; (2) others regard it as an objective reality, either (*a*) an actual entity, that in which phenomena endure, or (*b*) a system of relations (Leibnitz); (3) still others hold that it is both ideal and objective. Regarding the origin of the notion, the views are the same as those concerning space. In mathematics time is regarded as a continuous variable quantity, flowing onward at a constant rate. The measurement of time has in all ages been founded upon the rotation or revolution of the earth or the apparent motions or changes of the heavenly bodies. Modern astronomical observation, mathematical calculation, and mechanical instruments have given the measurement greater accuracy while retaining the general divisions.

Every event remembered is remembered as having happened in *time* past. This gives us the idea in the concrete. . . . We can now, by a process of abstraction, separate the *time* from the event, and we have the abstract idea of *time*. McCOSH *Psychology, Cognitive Powers* bk. ii, ch. 4, p. 156. [S. '86.]

According to the necessary conditions of human thought, events are contained in *time* as objects are in space, *time* existing before the event, measuring it as it passes, and still existing when the event is past. *Duration* and *succession* are more general words than *time;* we can speak of infinite or eternal *duration* or *succession*, but *time* is commonly contrasted with eternity. *Time* is measured or measurable *duration*. II. The sign of the infinitive mode.

In some instances *to* is a mere sign of the infinitive and with its verb can be replaced by the corresponding verbal noun in *ing*; as, he began *to beat* the drum (he began *beating* the drum); *to err* is human (*erring* is human). In Anglo-Saxon there were two similar constructions, an infinitive form, seldom used with the preposition, as nimanto take, and a gerundive form, generally used with *to*, as *to* nimanne. In the latter construction *to* had a dative force of purpose or intention. In passing into English this distinction was forgotten, and hence arose the practise, now dialectic or archaic, of governing the infinitive with *to* by another preposition; as, what went ye out *for to see*? hindered *from to drink*. In the same way, to express futurity, *about* is still used; as, *about to come*. With an infinitive *to* often indicates an indirect object or purpose. *To* as an infinitive sign has not come into use (1) after the auxiliaries *do*, *can*, *may*, *must*, *shall*, *will*; (2) (*a*) after *dare*, *help*, *need*, *please*, *go*: as, you *dare* not jump; *please* push; let us *go* swim, etc.; (*b*) after certain elliptical phrases, as *had rather*, *as lief*; as, I *had rather* study now; (*c*) after the object of *bid*, *feel*, *hare*, *hear*, *let*, *make*, and sometimes *find* and *know*; as, *make* him *run*; I *feel* you *tremble*; did you *find* him (*to be*) clever? I have *known* him (*to*) go there. In many of these constructions *to* may be used at pleasure. The word is often used colloquially to indicate an omitted infinitive or affirmation that has previously been expressed; as, you left your umbrella—did you mean *to*? he wrote because I asked him *to*.

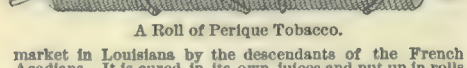
to-bac'co, to-bac'ō, *n.* **1.** The leaves of the tobacco-plant prepared in various ways, for smoking, chewing, snuffing, and for medicinal use.

The matured leaves of the green tobacco-plant are prepared for consumption by *curing*, effected usually by exposure to air, the sun, or fire. The cured leaves are allowed to absorb moisture until they become pliant. They are then assorted and packed in boxes, hogsheads, or bulks, where the tobacco undergoes a fermentation that develops

the aroma and flavor. Afterward it is worked up in the various forms suitable for market. The peculiar ingredients of the cured tobacco are: *Nicotin* (0.63 to 5.81 per cent.), *resin* and *fatty substances* (2.93 to 7.26), *glucose* (16.39 to nothing), *starch* (2.45 to 6.71), *albuminoids* (8.75 to 20.34), *pectic acid* (5.97 to 12.59), *citric acid* (0.43 to 5.80), *malic acid* (3.94 to 10.09), *oxalic acid* (0.84 to 3.49), *acetic acid* (0.31 to 1.62), *nitric acid* (3.23 to nothing), *ammonia* (0.19 to 1.65), *cellulose* (8.30 to 15.23), *sand* (0.55 to 4.17), *ash*, exclusive of sand (8.49 to 18.56). A constituent called *nicotianin* gives an odor, and an essential oily or resinous matter gives flavor. The analysis of the ash-constituents shows potash, soda, lime, magnesia, ferric oxid, alumina, manganous oxid, phosphoric anhydrid, sulfuric anhydrid, silicic anhydrid, and chlorin. Tobacco when cured is classified broadly as follows: *Class I.* **Smoking-tobacco,** embracing the seed-leaf, the Havana seed, and all other kinds used in the United States for cigars or for pipe-smoking. *Class II.* **Chewing-tobacco,** embracing all kinds used in the United States for chewing purposes. It is largely composed of the white Burley and the air-, sun-, and flue-cured tobaccos of Virginia and North Carolina. *Class III.* **Export tobacco,** embracing the heavy gummy product grown in Kentucky, Tennessee, Missouri, Maryland, Virginia, and North Carolina, that is cured, for the most part, by open wood-fires, which impart to the tobacco a creosotic flavor much liked abroad, but distasteful to the users of tobacco in the United States. This class of tobacco is exported to Great Britain, continental Europe, Africa, Mexico, South America, and the West Indies. The very finest grades are taken in Russia and the longest in Africa. Some sorts are put in all three classes. These three classes are subdivided into *grades*. The grades for the first class are *fillers*, *binders*, and *wrappers*. For the second class they are *trash*, *lugs*, *seconds*, and *leaf*. *Leaf* is still further assorted into (*a*) *short*, *long*, *dark*, *red*, *bright*, *mottled*, *yellow*, and (*b*) into *light*, *heavy*, *gummy*, and *fatty*. The grades of the third class comprehend all those of the first two classes, and are still further assorted to meet the requirements of the foreign markets into *spinners*, *saucers*, *cutters*, *shag*, *regie styles*, *Swiss wrappers* and *fillers*, *Africans*, *balers* (for Mexico, South America, and the West Indies), and into other sorts to meet special demands or uses, as for the navy or army. Although chiefly employed for smoking and chewing, tobacco finds also some use in medicine, as in asthma, and occasionally as a local application, as in sheep-washing, its juice being very destructive to insects. In its ordinary use it acts as a narcotic. Its excessive use results in nervous depression and prostration. Tobacco ranks first in the list of articles of general use. It is estimated that 800,000,000 people use it. The annual consumption per capita is 35 ounces; total consumption annually, 1,300,000 tons; average annual production of the United States, 480,000,000 pounds.

2. Any one of several plants of the genus *Nicotiana* (see NICOTIANA), especially *N. Tabacum*, the chief source of the tobacco of commerce, originally of tropical America, but now cultivated in other parts of the world, particularly in the United States from Florida to Wisconsin and from Louisiana to Massachusetts, and known in its different varieties as Virginia, Kentucky, Connecticut, Pennsylvania, and Wisconsin seed-leaf, Havana and Havana seed tobacco, etc.



The Tobacco (*Nicotiana Tabacum*). *a*, leaves; *b*, flowers; *c*, fruit.

It is a viscid pubescent annual from 3 to 6 feet high, and has large sessile ovate or lanceolate leaves diminishing in size from the base upward, and pink funnel-shaped flowers in a terminal panicle. The other principal source of the tobaccos of commerce is *N. rustica*, a smaller species with ovate petioled leaves and yellow flowers, called **green tobacco** from its leaves not becoming entirely brown in curing, and sometimes **wild tobacco** from its being found wild in parts of the United States, especially in Mexico, where it becomes perennial. It is adapted to cooler climates than *N. Tabacum*, and, though native in America, is grown chiefly in Europe, Asia, and Africa. The Persian or Shiraz tobacco is obtained from *N. Persica*. Tobacco was cultivated and used in tropical America before the arrival of the Europeans, who became acquainted with it in the first voyage of Columbus. The first plant was taken to Spain about 1558. Jean Nicot, the French ambassador, sent seeds from the Peninsula to Catherine di Medici, and this and his other services in diffusing a knowledge of the plant have been commemorated in the scientific name *Nicotiana*. See table of varieties, below.

At the outset the cultivation of *tobacco* was so lucrative that those who had no land planted in the streets of Jamestown.

ton'ic sol"-fa'. Of, pertaining to, or designating a system of teaching, writing, and reading music, especially vocal music, invented in England about 1812 by Sarah Glover, but developed, perfected, and introduced to public notice by John Curwen in 1850. It lays especial stress on the tonal relations of the various elements of the key, and endeavors to fix them in the mind by the different mental effects they produce—*do,* for instance, being called the *strong tone, mi* the *steady* or *calm tone,* etc. In its notation there is only one way of writing a diatonic scale, namely, by the initials of the syllables used in solmization (see SOLMIZATION), the absolute pitch of the key-tone being indicated at the outset. Thus the staff is entirely done away with, and all reference to an arbitrary keyboard is omitted. The rhythmic division is into bars, as in the common notation, but these are subdivided into *pulses* by colons, and, if necessary, into *half-pulses* and *quarter-pulses* by periods and commas. If a note is to be held over more than one pulse, it is indicated by writing a dash in these pulses. Position of a note in a higher or lower octave is denoted by superior or inferior numerals. The following shows the opening bars of "Auld Lang Syne," written in tonic sol-fa notation:

:s | d:—.d | d : m | r:—.d : r:				
Should auld ac - quaint - ance		be	for - got,	
m | d : d | m : s | l:—				
and nev - er brought to mind?

The income from the common fund contributed by the persons composing the tontine is divided at first among all, say 100. When one dies, his share passes, not to his heirs as part of his estate, but to the 99 survivors of the tontine, and so on continuously, the profit increasing to each survivor as the number diminishes, until the final survivor takes the whole, and at his death the tontine ceases.

Tools are sometimes named (1) from the thing formed by them; as, **astragal-tool** (having a bit of suitable form for shaping an astragal molding), **border-t.** (a bookbinders' tool for forming a border on a book); (2) from their use or purpose; as, **centering-t.** (for guiding a drill to the exact center of the end of a shaft, etc.), **coupling-t.** (for uniting objects, as lengths of pipe), **culling-t.** (for knocking apart oysters in culling), **gilding-t.**, etc.

[< AS. *tōl*, tool.]

Synonyms: apparatus, appliance, implement, instrument, machine, mechanism, utensil. A *tool* is both contrived and used for extending the force of an intelligent agent to something that is to be operated upon. Those things by which pacific and industrial operations are performed are alone properly called *tools*, those designed for warlike purposes being designated weapons. An *instrument* is anything through which power is applied and a result produced; in general usage, the word is of considerably wider meaning than *tool*; as, a piano is a musical *instrument*. *Instrument* is the word usually applied to *tools* used in scientific pursuits; as, we speak of a surgeon's or an optician's *instruments*. An *implement* is a mechanical agency considered with reference to some specific purpose to which it is adapted; as, an agricultural *implement*; *implements* of war. *Implement* is a less technical and artificial term than *tool*. The paw of a tiger might be termed a terrible *implement*, but not a *tool*. A *utensil* is that which may be used for some special purpose; the word is especially applied to articles used for domestic or agricultural purposes; as, kitchen *utensils*; farming *utensils*. An *appliance* is that which is or may be applied to the accomplishment of a result, either independently or as subordinate to something more extensive or important; every mechanical *tool* is an *appliance*, but not every *appliance* is a *tool*; the traces of a harness are *appliances* for traction, but they are not *tools*. *Mechanism* is a word of wide meaning, denoting any combination of mechanical devices for united action. A *machine* in the most general sense is any mechanical *instrument* for the conversion of motion; in this sense a lever is a *machine*; but in more commonly accepted usage a *machine* is distinguished from a *tool* by its complexity, and by the combination and coordination of powers and movements for the production of a result. A chisel by itself is a *tool*; when it is set so as to be operated by a crank and pitman, the entire *mechanism* is called a *machine*; as, a mortising-*machine*. (Compare MACHINE-TOOL, under MACHINE.) An *apparatus* may be a *machine*, but the word is commonly used for a collection of distinct articles to be used in connection or combination for a certain purpose, a mechanical equipment; as, the *apparatus* of a gymnasium; especially, for a collection of *appliances* for some scientific purpose; as, chemical or surgical *apparatus*; an *apparatus* may include many *tools*, *instruments*, or *implements*. *Implement* is for the most part and *utensil* is altogether restricted to the literal sense; *instrument*, *machine*, and *tool* have figurative use, *instrument* being used largely in a good, *tool* always in a bad sense; *machine* inclines to the unfavorable sense, as implying that human agents are made mechanically subservient to some controlling will; as, an *instrument* of Providence; the *tool* of a tyrant; a political *machine*.

The teeth of most mammals when well developed consist chiefly of dentin or ivory invested on its outer surface and crown with enamel and at its base with cement or crusta petrosa. The root of the tooth, embedded in the gum, has a small opening leading into the pulp-cavity, which is richly supplied with blood-vessels and nerves. In most mammals the teeth are differentiated into incisors, canines, and grinders (premolars and molars). In adult man there are 32 teeth — 2 incisors, 1 canine, 2 premolars, and 3 molars in each half of each jaw. These are preceded in the milk-dentition by 2 incisors, 1 canine, and 2 milk-molars in each half of each jaw, or 20 in all. See illus. under DENTITION.

S.] (1) A territorial division established by law for political or municipal purposes. (2) A subdivision of a county, being a quasi-corporate body, that may include villages and towns proper. (3) A political division of a State.

In the New England States the town is a political and corporate body created by the legislature, though historically, in most cases, practically existing before that body. It constitutes the political unit of the State, and as such sends representatives to the legislature. In other States, particularly in the West, the county is the political unit; the towns (more properly townships, if any, are its subdivisions, and are established by the county authorities instead of by the legislature, the counties being the units of representation. In many States, particularly in the South, the town or township system is entirely wanting.

Three types of rural local government are discernible in America. The first is characterized by its unit, the *Town* or Township, and exists in the six New England States. The second is characterized by a much larger unit, the county, and prevails in the southern States. The third combines some features of the first with some of the second, and may be called the mixed system. It is found, under a considerable variety of forms, in the middle and northwestern States.

lands, six miles square, as surveyed and designated of record under the provisions of the act of Congress of 1796.

By the United States surveys the public lands are divided by north-and-south lines run according to the true meridian and by others crossing them at right angles, so as to form townships six miles square, the corners of which are marked with progressive numbers, the township forming the unit of survey. The township is subdivided into sections, containing 640 acres each, by running through the same each way parallel lines at the end of every mile. The sections are numbered beginning in the extreme northeast corner of the township and proceeding west and east alternately, as shown in the diagram. The sections are subdivided into half-sections of 320 acres each, and these into quarter-sections of 160 acres. In the first subdivision of a quarter-section the line is to run north and south; and in case of the division of half a quarter-section (80 acres) the line of division must run east and west.

The principle that rules in tragedy and brings about the situation of extremity and desperation has varied in different ages and dramas. Fate and its workings are the favorite themes of Greek tragedy, which grew out of the worship of Dionysos. In modern tragedy the influence of Christianity may be seen in those dramas that exhibit the control of a divine moral government that finally and inevitably brings the guilty to punishment (as in the English drama of Shakespeare); or the sway of a gracious overruling Providence that vindicates itself in the moral elevation and purification of the innocent or penitent (as in the Spanish drama of Calderon — foreshadowed in the Book of Job). The ancient doctrine of fate is also still reflected in catastrophes that are the necessary outcome of circumstances too inflexible to be changed by human will.

Epic poetry employs narration, *tragedy* represents its facts as passing in our sight: in the former, the poet introduces himself as an historian, in the latter, he presents his actors, and never himself. KAMES *Elements of Criticism* ch. 22, p. 414. [F. J. H. '53.]

GREEN *English People* vol. iii, bk. vii, ch. 1, p. 15. [H. '79.]

II. *i.* **1.** [Archaic.] To do business; conduct operations. **2†.** To conduct oneself; act. [< L. *transigo*, pp. *transactus*, < *trans*, through, + *ago*, do.]

Synonyms: accomplish, act, carry on, conduct, do, negotiate, perform, treat. There are many acts that one may *do*, *accomplish*, or *perform* unaided; what he *transacts* is by means of or in association with others; one may *do* a duty, *perform* a vow, *accomplish* a task, but he *transacts* business, since that always involves the agency of others. To *negotiate* and to *treat* are likewise collective acts, but *negotiate* implies deliberation with adjustment of mutual claims and interests, while *transact* implies execution. Notes, bills of exchange, loans, and treaties are said to be *negotiated*, the word so used covering not merely the preliminary consideration, but the final settlement. Nations may *treat* of peace without result, but when a treaty is *negotiated* peace is secured; the citizens of the two nations are then free to *transact* business with one another.

trans-ac'tion, trans-ac'shun, *n.* **1.** The act of transacting, or the state of being transacted; the conduct or management of any undertaking or business affair.

Any direction of Christ or any direction or act of his apostles respecting the *transaction* of business in the church, is binding upon us, unless such direction or act was grounded upon peculiar circumstances then existing.
LEONARD WOODS *Works, Church Gov't* in vol. iii, lect. cxxii, p. 512. [J. P. J. '51.]

2. That which is or has been transacted; any matter or thing that has been brought partly or wholly to a conclusion; an affair; proceeding; as, a risky *transaction*.

'Tis done, the great *transaction's* done;
I am my Lord's, and he is mine.
DODDRIDGE *Happy Day* st. 3.

3. *Law.* Specifically, any act as affecting legal rights or obligations; in the civil law, the adjustment of a dispute by mutual concession and agreement; a compromise. **4.** *pl.* In certain learned societies, the published reports of the literary undertakings, such as the papers read and the discussions upon them. [F., < LL. *transactiones*, < L. *transactus*; see TRANSACT.]

Synonyms: act, action, affair, business, deed, doing, proceeding. One's *acts* or *deeds* may be exclusively his own; his *transactions* involve the agency or participation of others. A *transaction* is something completed; a *proceeding* is or is viewed as something in progress; but since *transaction* is often used to include the steps leading to the conclusion, while *proceedings* may result in *action*, the dividing line between the two words becomes sometimes quite faint, though *transaction* often emphasizes the fact of something done, or brought to a conclusion. Both *transactions* and *proceedings* are used of the records of a deliberative body, especially when published; strictly used, the two are distinguished; as, the Philosophical *Transactions* of the Royal Society of London give in full the papers read; the *Proceedings* of the American Philological Association give in full the *business* done, with mere abstracts of or extracts from the papers read. See ACT; BUSINESS.

Compare IMMANENCE.

His [God's] *transcendence* over the world, speedily discloses its [Brahmanism's] weakness in the obliteration of moral distinctions, and the swamping of finite individuality and freedom.

In this general sense the word is used by Kantians in many specific phrases; as, **transcendental analytic** (the treatment of the intuitive elements of cognition), **t. apperception** (the self-consciousness in synthetic perception), **t. cognition** (a priori knowledge), **t. dialectic** (that part of Kant's logic in which he attempts to show that cognition in certain particulars is radically delusive), **t. esthetic** (the doctrine of space and time as the antecedent forms of sense-perception), **t. idealism** (a form of subjective idealism; see IDEALISM), **t. object** (the thing in itself, the unknown and unknowable object), **t. paralogism** (an error into which the reason naturally falls in using the elementary principles of cognition), **t. reality** (the transcendental object), **t. unity** (the unity of an object effected by cognition).

Transcendental truths are simply those necessary, self-evident, axiomatic truths which transcend experience.
JOSEPH COOK *Transcendentalism* lect. ii, p. 48. [O. & CO. '78.]

Synonyms: a priori, intuitive, original, primordial, transcendent. *Intuitive* truths are those which are in the mind independently of all experience, not being derived from experience nor limited by it, as that the whole is greater than a part, or that things which are equal to the same thing are equal to one another. All *intuitive* truths or beliefs are *transcendental*. But *transcendental* is a wider term than *intuitive*, including all within the limits of thought that is not derived from experience, as the ideas of space and time. "Being is *transcendental*. . . . As being can not be included under any genus, but transcends them all, so the properties or affections of being have also been called *transcendental*." K.-F. *Vocab. Philos.* p. 530. "*Transcendent* he [Kant] employed to denote what is wholly beyond experience, being neither given as an a posteriori nor *a priori* element of cognition—what therefore transcends every category of thought." K.-F. *Vocab. Philos.* p. 531. *Transcendental* has been applied in the language of the Emersonian school to the soul's supposed *intuitive* knowledge of things divine and human, so far as they are capable of being known to man. *Transcendent*, *transcendental*, and *intuitive* are opposed to *empirical;* or, according to the philosophy of Kant, *transcendent* is opposed to *immanent*, and *transcendental* to *empirical*. See MYSTERIOUS.

See TRANSCENDENT, *n.*, 2. (2) Any form of transcendental philosophy, as Kantianism or the idealism of Schelling. See IDEALISM; KANTIANISM. (3) The religio-philosophical teachings of the New England school represented by Emerson and others. It has been characterized by the absence of a formal system of thought and belief, a somewhat mystical phraseology, the exaltation of the spiritual in a general sense over the material, a tendency to synthesis of God, nature, and man, an acceptance of all human manifestations as natural and not unmoral, an apotheosis of nature, and a belief in the self-sufficiency of the individual and individual insight.

Transcendentalism, as viewed by its disciples, was a pilgrimage from the idolatrous world of creeds and rituals to the temple of the Living God in the soul. CHANNING in *Memoirs of Margaret Fuller Ossoli*, *Transcendentalism* in vol. ii, p. 13. [P. S. & CO.'52.]

trea'son, trī'zn, *n.* **1.** *Crim. Law.* Betrayal, treachery, or breach of allegiance or obedience toward the sovereign or government.

At common law the crime of treason was but vaguely defined, which left to judges large latitude of construction, wherefrom various constructive treasons (see phrase) were created, and many cruelties ensued. In 1352, in the reign of Edward III., treason received a statutory definition in England. Under that statute treason consisted (1) in compassing or imagining the death of the sovereign or the heir apparent; (2) in having carnal knowledge of the king's wife, of the wife of the heir apparent, or of the king's eldest daughter, she being unmarried; (3) in levying war against the king in his realm; (4) in adhering to the king's enemies in his realm, giving them aid and comfort in the realm or elsewhere; (5) in counterfeiting the king's great or privy seal; (6) in counterfeiting the king's money, or bringing into the realm money counterfeit to that of England, knowing it to be false, "to merchandise and make payment withal"; (7) in slaying the chancellor or any of the judges while in their places doing their offices. Various subsequent statutes have amplified as well as modified the law as to treason in England.

Treason against the United States is declared by the Constitution to consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. To constitute "levying war," there must be an assemblage of persons for the purpose of effecting by force a treasonable design, as, for example, to revolutionize the government of the United States, or any government by them established in any of their territories. Mere conspiracy is not treason. But when war is actually levied, all who perform any act, however minute or remote from the scene of action, and who are actually leagued in the conspiracy, are traitors. [*Bollman's Case, 4 Cranch Rep. 75.*] It has been held that rebels, engaged in an armed insurrection against the United States, while they are guilty of treason in levying war against the government, can not, since they are citizens, be convicted of "adhering to the enemies" of the United States unless they unite with and sustain a hostile foreign power. [*The Case of Greathouse, 2 Abb. U. S. Rep. 364.*] Treason may be committed against a State as well as against the United States, and by a foreigner as well as by a citizen. **2.** A breach of faith; treachery. 1. A Trichina Encysted.
2. A Trichina Enlarged.

The females are viviparous and produce myriads of embryos, which bore their way through the intestinal wall and pass through the body-cavity or by the veins into the muscles and there surround themselves with cysts, which afterward become calcareous. The larvæ can live encysted for years (ten or more); they undergo no further development unless the infected flesh is swallowed by a suitable host, as insufficiently cooked pork by man, when sexual maturity is attained in the alimentary canal of the new host. The principal bearers of trichinæ are rats, which eat the dead bodies of infected animals. See TRICHINOSIS.

Trichina is parasitic in man, and in swine, and also in the rat, mouse, cat, fox and other forms which feed upon them. F. M. BALFOUR *Comp. Embryol.* vol. i, ch. 16, p. 378. [MACM. '85.]

trich'i-no'sis, trik'i-nō'sis, *n.* The peculiar disease produced by trichinæ in the intestines and muscles of the body; the flesh-worm disease. See TRICHINA.

The penetration of the embryonic trichinæ to the muscles causes excruciating agony, with diarrhœa, swelling of the limbs, fever, delirium, and general organic derangement. If death does not terminate the disease, the symptoms disappear when the worms cease to move, and they may remain in the flesh in their encysted condition without disabling the patient. Experiments have shown that the salting and smoking of cured meats are not fatal to trichinæ; hence the frequent infection from partaking of cured but uncooked meat, as smoked sausage and ham. Trichinæ are destroyed by a moist heat of 170° Fahrenheit, and consequently proper cooking renders meat safe.

Phrases:—**trigonometrical canon**, a table of the numerical values of trigonometrical functions.—**t. curve**, a curve whose equation involves only algebraic and trigonometrical functions.—**t. functions**, certain functions of an angle or arc used in trigonometry. They are most simply defined by referring to a triangle made by drawing a perpendicular from any point A (see fig. 1) of one side of the given angle a to the other side. (If the given angle is obtuse, the reference triangle is constructed on its supplement.) The functions of the angle a are then defined as ratios or fractions. They are the *sine*, $\frac{AB}{AC}$; the *cosine*, $\frac{CB}{AC}$; the *tangent*, $\frac{AB}{CB}$; the *cotangent*, $\frac{CB}{AB}$; the *secant*, $\frac{AC}{CB}$; and the *cosecant*, $\frac{AC}{AB}$. The position of the point A makes no difference, for all triangles so drawn for the same angle will be similar, and hence the values of the ratios will be unchanged. The functions may be represented also as lines by constructing the reference triangle in a circle whose radius is taken as unity and drawing additional lines as in fig. 2. The *sine* is then AB, the *cosine* CB, the *tangent* ED, the *cotangent* GF, the *secant* CE, and the *cosecant* CF. These are all spoken of as the sine, cosine, etc., of the arc AD as well as of the angle a. Another function sometimes included is the *versed sine*, or *versine*, equal to the difference between the cosine and unity (in fig. 2, BD). These functions are always abbreviated in writing as follows: sin a, cos a, tan a, cot a, sec a, cosec a, versin a.—**t. survey**, a survey accomplished by the trigonometrical calculation of lines after careful measurement of a base-line and of the angles made with this line by the lines toward points of observation: generally preliminary to a topographical survey. The invention of movable types is often popularly referred to as the invention of printing, since it made cheap printing possible. In some modern (so-called) type-setting-machines the individual type is dispensed with, and the line becomes the movable unit. (See LINOTYPE; TYPE-BAR.) Metal types are cast in a mold, and, according to the point system, now generally adopted, are .918 of an inch in height. They are usually nicked on the lower side for the convenience of the compositor, or sometimes on two sides for distribution by a mechanical distributor. Types of large size, as for poster-printing, are made of close-grained wood, as apple, maple, boxwood, etc., the end of the grain being placed upward, and subjected to pressure to give it a finish. Rubber types are much in use for hand-stamps, etc., and usually have a metal body half an inch or less in length, and a soft rubber face. Metal type is sometimes **copper-faced** by electrodeposition, to add to its wearing qualities. Type is **high-spaced** where shoulder-high spaces are used for electrotyping, otherwise **low-spaced.**

The differences in printing-types, as to body or size, are shown in the list below; differences in width render the type fat or lean, or, if quite marked, extended or condensed; differences in face are almost endless. The body of this dictionary is in roman face, the vocabulary words are in full-face, the headings "Compounds," "Phrases," etc., in antique, and cross-references in small caps. See CLARENDON; ENGLISH; BLACK LETTER; GOTHIC; ITALIC; RUNIC; SCRIPT; POINT SYSTEM.

2. One who exercises absolute or arbitrary power without legal warrant, whether ruling well or ill: so used originally in ancient Greece; an autocrat.

Tyrants arose in Greece especially in the 7th and 6th centuries B. C., generally as the leaders of revolts against oligarchies or aristocracies. Many of them — as Pisistratus, Orthagoras, Hiero, and Polycrates — were highly enlightened, and their rule on the whole was beneficent, forming the transition from aristocratic oligarchies to democracies.

It was of the essence of a '*tyrant*' that he had attained supreme dominion through a violation of the laws and liberties of the state; having done which, whatever the moderation of his after-rule, he would not escape the name. TRENCH *On the Study of Words* lect. v, p. 188, note. [K. P. & CO. '88.]

U

U u 𝔘 𝔲 *U u*

Roman. Black Letter. Script.

U, u, yū, *n.* [UES, U's, or *Us*, yūz, *pl.*] **1.** A letter: the twenty-first in the English alphabet; in Bell's "Visible Speech," ; the sign of high-back rounded vowel sound, simple as in *full* or prolonged as in *rule.* It is called a labial vowel.

In making *u* sounds the back of the tongue is raised as high as vowel sound can be made with the tongue slack. If the lips are rounded closer, a consonant rustle is heard, the English *w* in *woo.* If the tongue is lowered, o, e, u are made. This position of the tongue is similar to that in which *a* as in *far* is made; the difference of sound between o's and e's results from rounding the lips and the inner vowel-chamber for e.

The u sounds in English include not only u's of the Parent Speech, but many descendants of a and o, that have been influenced by labial letters near them, or by precession in unaccented syllables. In Sanskrit u is prevailingly pronounced u by the pundits, ū corresponds to Anglo-Saxon ō, which changes regularly to English ū, often written *oo* or *o:* Sans. *mās*, AS. *mōna* > Eng. *moon*, mūn; Sans. mūdar, AS. mōdor > *mother*, mudher, Ger. *mutter.* The simple short u sounds as in *full* are rare, .44 of one per cent., most of the earlier u's having changed to u. Some of the true u's are still written *o, oo, ou: bosom, good, could.*

Long u = iū, ĭu; yū, yu. As the back of the tongue is hard to move, the tip is apt to be raised with it and produce mixed *u* + *i* sounds, as in Greek upsilon (υ), French u, German ü, Latin and Anglo-Saxon y.

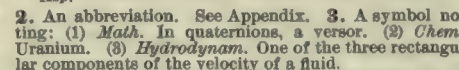
In modern English the mixed u's have opened into the diphthongs iū, ĭu, yū, yu, and as the single letter u remains unchanged in literature, it has taken the name *yu*, and the diphthong is called *long u.* This sound is described in England as always y + oo: *music* = myoozic. The traditional pronunciation in America gives *yu* only beginning a syllable, as in *use*, yūs. *pen-ury*, penyuri; no consonant murmur is heard in *music*, miūzic, nor is pure i heard; but a mixed i + u with u vanish.

The diphthong *u* came from the French mixed *u.* Anglo-Saxon *y* suffered precession to *i* and shares its sounds. Long *u*'s from all languages are now made diphthongs when Anglicized. But *rū* (*rude*) has pure u; *iu* (*flūit*) also in many authorities; after *t, d, s, s* the *i* = *y* of *yu* combines and gives *tyū* > *chū, dyū* > *jū, shū, zhū:* nēchur, verjur, shūr, plezhur. This iū in transition is denoted in the pronunciation by jū, or when the ū varies to u, by jŭ: vir'tjū, nū'tjūr. Pure ū is often written *oo*, sometimes *o: poor, move;* diphthong ū sometimes *ue, eu, eo: due, feud, few.*

The long *u*'s are reported by Professor Whitney as making up two per cent. of the sounds in our literature.

U, u, *n.* [U's, ūz, *pl.*] The twenty-third letter in the alphabet of the Spelling Reform Association; in Bell's "Visible Speech,"): a sign of mid-back obscure vowel sound, simple as in *but*, prolonged as in *burn.* It is often called the neutral vowel, the obscure vowel, the natural vowel, and commonly, but deceptively, short u.

The distinctive trait of this sound is the want of clear resonance in the vowel-chamber through lack of tension in the organs or of strength in the stream of voice. In accented syllables u oftenest comes from *u* as in *full*, frequently represented by *o, ou* in modern English as in *son* < AS. *sunu, tongue* < *tunge, young* < *jung;* often from Romanic *o: color*, culer; sometimes from ō > oo: *flood* < *flōd;* ū appears before *r: bŭrn.* In unaccented syllables the law of least effort lets in u ŭ sounds in place of all the other vowels. In southern English the neutral sound is widely used, and fully accepted and written by the phonetists: Dhu Furst Buk ov Mozez kōld Genusiz. In dhu buginning God kriētud dhu hevunz and dhi urth. MAX MÜLLER *Outline Dictionary for Missionaries* p. ix. [TR. & CO. '67.] But in general standard English the resonant vowels are recognized as primary sounds of oratory and pedagogy in a large number of words which also admit obscure sounds as colloquial weakenings.



In the pronunciation of this dictionary the primary alphabetic spelling in such words is given, and the colloquial weakening is indicated by a diacritic below the letter, ˘ for variation towards u ŭ, ˜ for variation towards *i:* Dhe Fȳrst Buk ov Mōzez kōld Genesis. In dhe beginning God creētud dhe hevnz and dhi urth.

The obscure u is next to i in frequency among the vowel sounds as found in English literature by Professor Whitney, and the fourth in the alphabet, 5.66 per cent.; ŭ has 1.85 per cent. W. D. WHITNEY *Oriental and Linguistic Studies* second series, p. 274. [S. '74.)

Capital U is from Roman U < Gr. Υ Υ differentiated by the Greeks from the signs for consonant *u* = *w*, old Greek ϒ ϝ < Phenician ϒ waw or vau, from which F also is derived. (For earlier history, see F.) F, U, V, W, Y are all from Phenician *vau.* Latin V U were graphic variations merely, and *v u* continued to be so to the 16th century. In the 9th century runic w came into use in Anglo-Saxon. The rune for *u* is the second in the futhorc: it is named *ūr*, ox.

In the scientific alphabet the common form of lower-case u is retained for its original sound, as in *full*, matched with a new capital (U). The capital U with a similar lower-case (u) is given to the obscure sound.

The history of the characters is represented as follows:

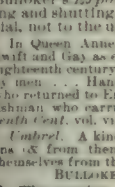
Umbrellas, though seen in Egyptian and Assyrian sculptures, on Greek vases and figurines, and in medieval manuscripts, were not used in Europe until the 15th century as shelters from rain. In the East, as in Siam, they are emblems of royalty. In the definition of "umbrel" cited below from Bullokar's *Expositour*, "Fan" apparently refers to the opening and shutting of the umbrella, and perhaps to its material, not to the use to which it was put.



In Queen Anne's time it (the umbrella) is mentioned both by Swift and Gay as employed by women, but up to the middle of the eighteenth century it appears never to have been used in England by men . . . Hanway, the famous traveller and philanthropist, who returned to England in 1750, is said to have been the first Englishman who carried an *umbrella*. um'laut, ūm'lout, *rt. Philol.* To form or sound (a vowel) with the umlaut.

um'laut, *n.* *Philol.* A change of one vowel to another more like a following *a*, *i*, or *u*, as of *a* followed by *i* to the intermediate sound *e*: *man* + *i* > *meni*. It took place regularly in early German, Scandinavian, and Anglo-Saxon. It should be distinguished from those significant changes of the verb-root in inflection which are produced by accent; these are called *ablaut*.

The umlaut produced by *u* is not now found in German. Umlaut was sometimes represented by writing a small letter above *a*, *o*, *au*, or *u*, or by writing the two side by side, or (as now in German, Danish, and Swedish) by dots (¨) above the mutated vowels; as, *lamm*, pl. *lämmer*; *soke*, pl. *söke*; *haws*, pl. *hauser*; *quat*, *quäten*, etc. It has ceased to act in modern English, but the old changes survive in many words, as in the so-called irregular plurals (*men*, *geese*, *mice*, *brethren*, *kine*, etc.) and derivatives, as *gild* < *gold*, *heul* < *hâl* (whole), *English* < *Anglise*, *French* < *Frinkish*, etc. It is still active in Icelandic, but was not found in Gothic.

The *Umlaut* is a modification that has risen in our stock of languages within the historical period. There is no trace of it in the Mœso-Gothic, but it appears in the Old High Dutch and Anglo-Saxon. . . . The Conquest gave the death-blow to the *Umlaut* among us. EARLE *Philol. Eng. The following is a list of unimportant or self-defining words beginning with *un-*. (1) In the verbs in the list, *un-* gives the sense of reversal (see UN-² above); as, *unanchor*, 'to weigh anchor'; *unattire*, 'to undress.' (2) In the nouns and the adjectives (including participles in *-ing* and *-ed*) it has simple negative force (as in *uncharity*, 'lack of charity'; *unabiding*, 'not abiding; passing on'; *unaided*, 'not aided or assisted': see UN-¹), except in such of the words in *-ed* and *-ing* as may be regarded as participles of a corresponding verbal form in UN-². Thus, *unburdened* may be regarded as an adjective (UN-¹ + BURDENED) meaning 'not burdened,' or as a participle of the verb *unburden* meaning 'relieved of a burden.' (3) Many of the adjective forms have derivative adverbs in *-ly* and nouns in *-ness* and *-ity* whose meanings are evident.
